

WHAT IS A USER?

A user account is used to provide security boundaries between different people and programs that can run commands.

```
# id <username>
```

```
# id user1
```

```
# id devops
```

-create user

```
# useradd <username>      ->Linux original
```

or

```
# adduser <username>      ->perl script
```

ex:

```
# useradd user1
```

```
# adduser user2
```

when try to create user on Linux, some files will update immediately:

```
1-/etc/passwd      ->stores user's info
```

```
2-/etc/shadow      ->stores user's credentials
```

```
3-/etc/group       ->store's group's info
```

```
4-/etc/gshadow     ->stores group's credentials
```

explain text files operate

-cat

```
# cat /etc/passwd
```

-head

```
# head /etc/passwd      ->first 10lines
```

```
# head -3 /etc/passwd   ->first 3lines
```

or

```
# head -n 3 /etc/passwd
```

-tail

```
# tail /etc/passwd      ->last 10lines
```

```
# tail -5 /etc/passwd   ->last 5lines
```

or

```
# tail -n 5 /etc/passwd
```

-wc world count

```
# wc /etc/passwd
```

```
32 74 1726 /etc/passwd
```

```
# wc --help
```

```
# wc -c bytes
```

```
-l lines
```

```
-m character
```

```
-w words
```

```
# wc -l /etc/passwd
```

```
32 /etc/passwd
```

```
# wc -w /etc/passwd
```

```
74 /etc/passwd
```

```
# wc -m /etc/passwd
```

```
1726 /etc/passwd
```

-grep ->filter user input

```
# grep "a" /etc/passwd
```

```
# grep "root" /etc/passwd
```

```
# grep "9" /etc/passwd
```

-lines started by "root"

```
# grep ^"root" /etc/passwd
```

-lines ended by "root"

```
# grep "nologin"$ /etc/passwd
```

what is | character?

output of one command becomes input for other command.

```
# cat /etc/passwd | grep "root"
```

```
# cat /etc/passwd | grep "root" | wc -l
```

```
2
```

```
# less <filename>
```

```
# more <filename>
```

```
1-/etc/passwd      ->stores user's info
# grep "user1" /etc/passwd
user1:x:1001:1001::/home/user1:/bin/bash
```

```
user1              ->username
x                  ->password symbol
1001               ->user-id(uid)
1001               ->group-id(gid)->primary g-id
::                 ->comment
/home/user1        ->default user home dir
/bin/bash          ->default shell
```

what is user-id(uid)

Linux knows users by id, by default started from 0 to 60000

```
0                  ->superuser(root)
1 to 999           ->system/service user
1000 to 60000      ->users/regular users
```

ex:

```
# id -u <username>
```

```
# id -u root
```

```
# id -u user1
```

what is group-id(gid)

on Linux we have 2 groups:

1-primary

2-secondary

1-primary

-on Linux by default we don't have user without primary-group.

-when create user if won't mention primary group, Linux will create a group based-on username and will join user to that group.

ex:

```
# useradd user3
```

when press Enter, s group based-on username will create inside /etc/group and user will join it.

```
# tail -1 /etc/group
```

```
user3:x:1003:      ->1003 group-id
```

```
# tail -1 /etc/passwd
```

```
user3:x:1003:1003::/home/user3:/bin/bash
```

Linux knows groups by id, by default started from 0 to 60000

```
0                  ->superuser group(root)
1 to 999           ->system/service group
1000 to 60000      ->group
```

```
# id -g root
```

```
0
```

```
# id -g user1
```

```
1001
```

```
/home/user1       ->default user's home dir
```

```
/bin/bash         ->default shell
```

How Linux knows about **default home dir** and **default shell**?

on Linux some templates are available

1-/etc/default/useradd

2-/etc/login.defs

```
1-/etc/default/useradd
```

```
# cat /etc/default/useradd
```

```
HOME=/home
```

```
SHELL=/bin/bash
```

```
# cat /etc/shells
```

```
/bin/sh
```

```
/bin/bash
```

```
or
```

```
# chsh -l
```

```
/bin/sh
```

```
/bin/bash
```

```
# vim /etc/default/useradd
```

```
SHELL=/bin/sh
```

```
:wq!
```

```
# useradd user4
# tail -1 /etc/passwd
user4:x:1004:1004::/home/user4:/bin/sh
```

-create user with custom parameters

```
# useradd      -u uid
                -g p-gid
                -G sec-gid
                -s shell
                -d home dir
                -M user without home dir
                -r system user
                -o non-unique uid
                -c comment
```

```
# useradd --help
```

ex:

```
# useradd -u 2000 user6
```

```
# useradd -s /bin/sh user7
```

```
# id -u user5
```

```
1500
```

```
# useradd -u 1005 -o user8
```

```
# useradd -r user9
```

```
# id -u user9
```

```
988
```

-switch between users by use 'su' command switch user

```
# su - user4
```

```
$ pwd
```

```
/home/user4
```

-to back type 'exit' or press Ctrl+d

shift to user home dir

```
# cd /home/<user-name>
```

```
# cd /root
```

or

```
# cd /home/user1
```

or

```
# cd
```

or

```
# cd ~
```

2types of shell available on Linux:

1-loggingable shells ->can login to OS through these shells. likes /bin/bash, /bin/sh

2-non-loggingable shell ->/sbin/nologin

```
# useradd -s /sbin/nologin user10
```

```
# tail -1 /etc/passwd
```

```
user10:x:2002:2003::/home/user10:/sbin/nologin
```

```
# passwd user10
```

```
# su - user1
```

```
$ su - user10
```

```
Password:
```

```
This account is currently not available.
```

-set password for user on Linux

```
# passwd user1
```

```
New password:
```

```
Retype new password:
```

or

```
# echo "<password>" | passwd --stdin <username>
```

```
# echo "redhat" | passwd --stdin user2
```

```
# passwd -S status
```

```
-l lock password
```

```
-u unlock password
```

```
-d delete password
```

```
2-/etc/shadow    ->stores user's credentials
user6:!!:18756:0:99999:7:::
-username
-password
    :!!:      password doesn't set yet
    :$1$      password has been set, Message Digest No.5-MD5
    :$6$      password has been set, Secure Hash Algorithm-SHA(def.)
    :!!$1$    password has been set, Message Digest No.5-MD5, its locked
    :!!$6$    password has been set, Secure Hash Algorithm-SHA, its locked
    : :      password deleted
```

```
# tail /etc/login.defs
# Use SHA512 to encrypt password.
```

```
ENCRYPT_METHOD SHA512
```

```
# passwd -S user1
user1 PS 2021-05-09 0 99999 7 -1 (Password set, SHA512 crypt.)
# passwd -l user1
# passwd -S user1
user1 LK 2021-05-09 0 99999 7 -1 (Password locked.)
```

```
# passwd -u user1
# passwd -S user1
user1 PS 2021-05-09 0 99999 7 -1 (Password set, SHA512 crypt.)
```

```
# passwd -d user1
# passwd -S user1
user1 NP 2021-05-09 0 99999 7 -1 (Empty password.)
```

password aging

```
-last date password changed, its random number for each Linux and means when password has been changed. (def. value is 01.01.1970)
-minimum password age,      for how many days' user cannot change the password.
-maximum password age,      maximum how many days' password will work
-warning,                    how many days before Expire Linux will start warn to user
-inactive,                   how many days after Expire user will be able to login and change password by self
-expire
-blank
```

```
-change password aging parameters by chage command. change age
```

```
# chage -l list
    -d last date pass changed
    -m min pass age
    -M max pass age
    -W warning
    -I Inactive
    -E expire
```

ex:

```
min pass age: 2, max pass age: 30, warning: 5, Inactive: 2
```

```
# chage -l user2
Last password change          : May 09, 2021
Password expires              : never
Password inactive             : never
Account expires               : never
Minimum number of days between password change : 0      0 means change password immediately is possible
Maximum number of days between password change : 99999
Number of days of warning before password expires : 7
```

```
# chage -m 2 -M 30 -W 5 -I 2 user2
# chage -l user2
Last password change          : May 09, 2021
Password expires              : Jun 08, 2021
Password inactive             : Jun 10, 2021
Account expires               : never
Minimum number of days between password change : 2
Maximum number of days between password change : 30
Number of days of warning before password expires : 5
```

-force user to change password after first login?

```
# chage -d 0 user2
```

```
# chage -l user2
```

```
Last password change           : password must be changed
```

```
Password expires               : password must be changed
```

```
Password inactive              : password must be changed
```

```
Account expires               : never
```

```
Minimum number of days between password change : 2
```

```
Maximum number of days between password change : 30
```

```
Number of days of warning before password expires : 5
```

```
# su - user1
```

```
$ su - user2
```

```
Password: redhat
```

```
You are required to change your password immediately (administrator enforced)
```

```
Current password: redhat
```

```
New password:
```

```
Retype new password:
```

-delete user

to delete users, use:

```
# userdel <username>          ->user home dir still available
```

```
# userdel user10
```

```
# ll /home
```

```
drwx-----. 2 2002 2003 62 May 9 12:16 user10
```

```
or
```

```
# userdel -rf user1          -<will delete everything
```

What is group

location to add multiple users for specific purpose.

-Create group

```
# groupadd ibm
```

```
# groupadd dell
```

/etc/group responsible to store group's info

```
# tail /etc/group
```

```
dell:x:2004:
```

```
dell      ->group name
```

```
x         ->password symbol
```

```
2004      ->gid, maybe use as primary. maybe use as secondary
```

```
:         ->list of secondary members
```

ex:

-create **user11** with **dell** group as primary group

```
# useradd -g dell user11
```

```
# tail -1 /etc/passwd
```

```
user11:x:2002:2004::/home/user11:/bin/bash
```

-create **user12** with **dell** group as secondary group

```
# useradd -G dell user12
```

```
# tail -1 /etc/passwd
```

```
user12:x:2003:2007::/home/user12:/bin/bash
```

```
# tail /etc/group
```

```
dell:x:2004:user12
```

```
# id user5
```

```
uid=1005(user8) gid=2002(user8) groups=2002(user8)
```

```
# usermod -G dell user5
```

```
# tail /etc/group
```

```
dell:x:2004:user12,user5
```

NOTE:

-primary group is unique and un-append-able. it's not possible to append a user to more than one primary group.

-add/append a user to unlimited secondary group.

append user to multiple secondary group

-append

```
# gpasswd -a <username> <group-name>
```

```
-a add/append
```

```
-d delete
```

```
# gpasswd -a user12 coss
```

```
# gpasswd -a user12 sony
```

or

```
# usermod -a -G <group-name> <user-name>
```

```
# usermod -a -G ibm user12
```

or

```
# usermod -aG <group-name> <user-name>
```

```
# usermod -aG user9 user12
```

-remove

```
# gpasswd -d <user-name> <group-name>
```

```
# gpasswd -d user12 user9
```

change existing group parameters

change existing group name to other one

ex:

change **dell** group name to **moon** group name

```
# tail /etc/group
```

```
dell:x:2004:user12,user5
```

```
# groupmod -n <new name> <old name>
```

```
# groupmod -n moon dell
```

```
# tail /etc/group
```

```
moon:x:2004:user12,user5
```

delete group

-primary

ex:

```
# groupdel moon
```

```
groupdel: cannot remove the primary group of user 'user11'
```

NOTE: chage primary group for user11 first then try to delete moon group again

```
# tail /etc/group
```

```
moon:x:2004:user12,user5
```

```
# grep "user11" /etc/passwd
```

```
user11:x:2002:2004::/home/user11:/bin/bash
```

```
# usermod -g ibm user11
```

```
# groupdel moon
```

-secondary

```
# tail /etc/group
```

```
sony:x:2005:user12
```

```
# groupdel sony
```

```
#
```
